## Collision Planar Impact Analysis

This collision model is based on the Planar Impact Mechanics Model (PIM) ${ }^{1}$ of Raymond M. Brach. The PIM model is a time forward calculation that inputs linear and angular velocites of two vehicles colliding at a point $C$ along a normal surface at angle $\Gamma$, given two constraints for the Coefficient of Restitution, $\varepsilon$, and the Impulse Ratio, $\mu$. PIM then solves this for the final velocities.
The coefficient of restitution is the ratio of the Final Normal RelativeVelocity at the common point c contact of the collision (C), normal to $\Gamma, \mathrm{V}_{\mathrm{crn}}$. to the initial normal relative velocity, $\mathrm{v}_{\mathrm{crn}}$. Then the coefficient of restitution, $\varepsilon$, equals $-\mathrm{V}_{\mathrm{crn}} / \mathrm{v}_{\mathrm{crn}}$. Equivalently, $\varepsilon=\left(\mathrm{V}_{2 \mathrm{n}}-\mathrm{V}_{1 \mathrm{n}}\right) /\left(\mathrm{v}_{2 \mathrm{n}}-\mathrm{V}_{1 \mathrm{n}}\right) \quad$ or $\quad \varepsilon=-\operatorname{Pr} / \mathrm{P}$ i

The Impulse ratio gives the tangential common velocity condition, that is, where $\mathbf{V}_{\mathbf{1 C t}}-\mathbf{V}_{\mathbf{2 C t}}=\mathbf{0}$. Let $\beta$ be the fraction of $\mu_{0}$ that is used for the reconstruction. Then $\mu=\beta * \mu_{0}$, where $\beta$ is a measure of the intervehicle sliding.

## Goals of this Analysis:

Develop a Mathcad implementation and an explicit and deeper investigation of the PIM.
Express results as functions of $\varepsilon$ and $\beta$, for example, as $\mathrm{V}_{\mathrm{x} 1}(\varepsilon, \beta)$, for the final $x$-velocity of car 1 .
We can then calculate and show the sensitivties of final results to the coefficient of restitution $\varepsilon$.
Find the Optimum values of $\varepsilon$ and $\mu$ to minimize the Least Squares error of the final velocities.
Verify results by comparing against the RISCAC 9 collision and Fig 7.14 ${ }^{1}$.
This functional form allows the final results to be graphed as shown on pages 8 and 9 .

## Validation: Analysis of RICSAC Collision \#9 Brach ${ }^{1}$ Fig 7.14

The Research Input for Computer Simulation of Automobile Collisions (RICSAC) was a federally funded research project by CALSPAN Corporation's Advanced Technology Center. The intent was to provide critical data for validating existing and future computer analysis and simulation programs. There were 12 series of staged collsions configurations. Collision \#9 was an oblique 90 degree collsion as illustrated below.

Note: Brach notation ${ }^{1}$ has initial $\mathrm{v}_{\mathrm{x} 1}$ as negative, $\theta 1=0$ degrees, $\theta 2=90$ degrees, and $\Gamma=0$ degrees Detailed RICSAC 9 input conditions in the PIM model are given in the table on the following page. The orientation used in the Brach Fig 7.14 for RICSAC 9 differs from the above.

## PIM - Forward Calculation Conservation of Momentum Model

The drawing below shows the general relationships between the Brach variables https://www.brachengineering.com/content/vcrware-samples/planar-impact-mechanics.pdf

## Given:

1. Initial velocity components: $\mathrm{v}_{1 \mathrm{x}}, \mathrm{v}_{1 \mathrm{y}}, \mathrm{v}_{2 \mathrm{x}}, \mathrm{v}_{2 \mathrm{y}}, \omega$, where $\omega$ is relative to x or street axis.
2. Vehicle physical properties: Weight (mass $_{1}$, Weight (mass $_{2}$, and Moments of Inertia: $I_{1}, I_{2}$
3. Heading orientation angles: $\theta_{1}, \theta_{2}$ (relative to $x$ axes). All angles, except $\phi$, are relative to $x$ axis
4. Heading angles for head on collision have a datum of 0 degrees CCW for Vehicle1 moving to let
5. Collision damage characteristics of common point C: $d_{1}, d_{2}, \phi_{1}, \phi_{2}$, (ds to CM, $\phi s$ relative to $\theta$ s)

The contact surface ( $\sim$ stiffness) is the time and space average of the deformed contact surface.
C is the common/impact center point of the intersection of the impulse and contact surface.
Energy loss: $\varepsilon$ (coeff of normal restitution), The normal impulse ( $\mathrm{P}=\Delta \mathrm{p}$ ) can be divided into 2 parts Pa during approach and $\operatorname{Pr}$ during rebound, such that $\varepsilon=-\mathrm{Pr} / \mathrm{Pa}, \varepsilon$ of kinetic coeff restitution Equivalently, $\varepsilon=\left(V_{2 n}-V_{1 n}\right) /\left(v_{2 n}-v_{1 n}\right)$. Guess $\mu$ (ratio of tangential to normal impulse) Max $\mu_{0}$. A normal and tangential coordinate system is referenced wrt a common contact or crush surface. $\Gamma$ is the angle of the normal to the collision plane relative to the x or street axis. N like x , is + to Rig Input conditions are given in lower case and Output parameters are upper case.

Find: Final velocities $\mathbf{V}_{\mathbf{x} \mathbf{1}}, \mathbf{V}_{\mathbf{x} \mathbf{2}}, \mathbf{V}_{\mathbf{y} 1}$, and $\mathbf{V}_{\mathbf{y} \mathbf{2}}$ and angular momenta, $\boldsymbol{\Omega}_{\mathbf{1}}, \mathbf{\Omega}_{\mathbf{2}}$.

## Initial Conditions: Vehicle 1

$\mathrm{m}_{1}:=\frac{\mathrm{w}_{1}}{\mathrm{~g}} \quad \mathrm{~m}_{2}:=\frac{\mathrm{w}_{2}}{\mathrm{~g}} \quad \mathrm{k}_{1}:=\sqrt{\frac{\mathrm{I}_{1}}{\mathrm{~m}_{1}}}=3.731 \mathrm{ft} \quad \mathrm{k}_{2}:=\sqrt{\frac{\mathrm{I}_{2}}{\mathrm{~m}_{2}}}=5.097 \mathrm{ft}^{\mathbf{l}} \quad \mathrm{k}_{1}{ }^{2}=13.923 \mathrm{ft}^{2} \quad \mathrm{k}_{2}{ }^{2}=25.974 \mathrm{ft}^{2}$ Center of Mass $\mathrm{m}_{\mathrm{C}}:=\frac{\mathrm{m}_{1} \cdot \mathrm{~m}_{2}}{\mathrm{~m}_{1}+\mathrm{m}_{2}} \quad \mathrm{v}_{1}:=\sqrt{\mathrm{v}_{\mathrm{x} 1}{ }^{2}+\mathrm{v}_{\mathrm{y} 1}{ }^{2}}=31.09 \cdot \frac{\mathrm{ft}}{\mathrm{s}} \quad \mathrm{v}_{2}:=\sqrt{\mathrm{v}_{\mathrm{x} 2}{ }^{2}+\mathrm{v}_{\mathrm{y} 2}{ }^{2}}=31.09 \cdot \frac{\mathrm{ft}}{\mathrm{s}}$

## Define Sin and Cos functions to work with degrees and not radians

Degrees to radians: $\operatorname{Sin}(\theta):=\sin (\theta \cdot \operatorname{deg}) \quad \operatorname{Cos}(\theta):=\cos (\theta \cdot \operatorname{deg}) \quad$ "deg" converts radians to degrees

## From the above diagram

The common point of collision, C , is located relative to the C of G by distances $\mathrm{d} 1, \mathrm{~d} 2$ and angles $\phi_{1}, \phi_{2} . \mathbf{d}_{\mathrm{a}}$ to $\mathbf{d}_{\mathbf{d}}$ are the momentum arms for normal and tangential Impulse $\mathbf{P}(\Delta \mathrm{p})$ components.
$d_{a}:=d_{2} \cdot \operatorname{Sin}\left(\theta_{2}+\phi_{2}-\Gamma\right) \quad d_{b}:=d_{2} \cdot \operatorname{Cos}\left(\theta_{2}+\phi_{2}-\Gamma\right) \quad d_{a}=4.864 \cdot f t$
$d_{c}:=d_{1} \cdot \operatorname{Sin}\left(\theta_{1}+\phi_{1}-\Gamma\right) \quad d_{d}:=d_{1} \cdot \operatorname{Cos}\left(\theta_{1}+\phi_{1}-\Gamma\right)$
Given: The Normal and Tangential Velocity Components relative to the $\Gamma$ normal axis $\mathrm{v}_{\mathrm{n} 1}:=\mathrm{v}_{\mathrm{x} 1} \cdot \cos (\Gamma \cdot \operatorname{deg})-\mathrm{v}_{\mathrm{y} 1} \cdot \sin (\Gamma \cdot \operatorname{deg}) \quad \mathrm{v}_{\mathrm{n} 1}=-31.09 \cdot \frac{\mathrm{ft}}{\mathrm{s}}$
$\mathrm{v}_{\mathrm{t} 1}:=\mathrm{v}_{\mathrm{x} 1} \cdot \sin (\Gamma \cdot \operatorname{deg})+\mathrm{v}_{\mathrm{y} 1} \cdot \cos (\Gamma \cdot \operatorname{deg}) \quad \mathrm{v}_{\mathrm{t} 1}=0 \cdot \frac{\mathrm{ft}}{\mathrm{c}}$
$\mathrm{v}_{\mathrm{n} 2}:=\mathrm{v}_{\mathrm{x} 2} \cdot \cos (\Gamma \cdot \mathrm{deg})+\mathrm{v}_{\mathrm{y} 2} \cdot \sin (\Gamma \cdot \mathrm{deg}) \quad \mathrm{v}_{\mathrm{n} 2}=0 \cdot \frac{\mathrm{ft}}{\mathrm{c}}$
$\mathrm{v}_{\mathrm{t} 2}:=\mathrm{v}_{\mathrm{x} 2} \cdot \sin (\Gamma \cdot \mathrm{deg})+\mathrm{v}_{\mathrm{y} 2} \cdot \cos (\Gamma \cdot \mathrm{deg}) \quad \mathrm{v}_{\mathrm{t} 2}=31.09 \cdot \frac{\mathrm{ft}}{\mathrm{s}}$

$$
\begin{aligned}
\mathrm{d}_{\mathrm{b}} & =2.775 \cdot \mathrm{ft} \\
\mathrm{~d}_{\mathrm{c}} & =0.502 \cdot \mathrm{ft} \\
\mathrm{~d}_{\mathrm{d}} & =4.774 \cdot \mathrm{ft}
\end{aligned}
$$

## Velocity of "C" Common Point Normal Velocity, ven

Given: The Initial Common/Impact Velocity of Point of Collision point, C.

$$
\mathrm{v}_{\mathrm{cn} 1}:=\mathrm{v}_{\mathrm{n} 1}+\mathrm{d}_{\mathrm{c}} \cdot \omega_{1} \cdot \operatorname{deg}=-31.09 \frac{\mathrm{ft}}{\mathrm{~s}} \quad \mathrm{v}_{\mathrm{cn} 2}:=\mathrm{v}_{\mathrm{n} 2}-\mathrm{d}_{\mathrm{a}} \cdot \omega_{2} \cdot \operatorname{deg}=0 \frac{\mathrm{ft}}{\mathrm{~s}}
$$

Relative normal velocity vehicle 1 to vehicle 2
Eq. 6.46

$$
\begin{array}{ll}
\mathrm{v}_{\mathrm{rnx}}:=\left(\mathrm{v}_{\mathrm{n} 2}-\mathrm{d}_{\mathrm{a}} \cdot \omega_{2}\right)-\left(\mathrm{v}_{\mathrm{n} 1}-\mathrm{d}_{\mathrm{c}} \cdot \omega_{1}\right)=31.09 \frac{\mathrm{ft}}{\mathrm{~s}} & \mathrm{v}_{\mathrm{crn}}:=\mathrm{v}_{\mathrm{n} 1}+\mathrm{d}_{\mathrm{c}} \cdot \mathrm{R} \cdot \omega_{1}-\mathrm{v}_{\mathrm{n} 2}+\mathrm{d}_{\mathrm{a}} \cdot \mathrm{R} \cdot \omega_{2}=-31.09 \frac{\mathrm{ft}}{\mathrm{~s}} \\
\mathrm{v}_{\mathrm{ct} 1}:=\mathrm{v}_{\mathrm{t} 1}-\mathrm{d}_{\mathrm{d}} \cdot \omega_{1} \cdot \operatorname{deg}=0 \frac{\mathrm{ft}}{\mathrm{~s}} & \mathrm{v}_{\mathrm{ct} 2}:=\mathrm{v}_{\mathrm{t} 2}+\mathrm{d}_{\mathrm{b}} \cdot \omega_{2} \cdot \operatorname{deg}=31.09 \frac{\mathrm{ft}}{\mathrm{~s}}
\end{array}
$$

Given: The Initial Common/Impact Velocity of Point of Collision, C.

$$
\begin{aligned}
& \mathrm{v}_{\mathrm{rn}}:=\left(\mathrm{v}_{\mathrm{n} 2}-\mathrm{d}_{\mathrm{a}} \cdot \omega_{2}\right)-\left(\mathrm{v}_{\mathrm{n} 1}-\mathrm{d}_{\mathrm{c}} \cdot \omega_{1}\right)=31.09 \cdot \frac{\mathrm{ft}}{\mathrm{~s}} \\
& \mathrm{~A}:=1+\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\mathrm{c}}{ }^{2}}{\mathrm{~m}_{1} \cdot \mathrm{k}_{1}{ }^{2}}+\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\mathrm{a}}{ }^{2}}{\mathrm{~m}_{2} \cdot \mathrm{k}_{2}{ }^{2}}=1.3 \quad \mathrm{~B}:=\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\mathrm{c}} \cdot \mathrm{~d}_{\mathrm{d}}}{\mathrm{~m}_{1} \cdot \mathrm{k}_{1}{ }^{2}}+\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\cdot} \cdot \mathrm{d}_{\mathrm{b}}}{\mathrm{~m}_{2} \cdot \mathrm{k}_{2}{ }^{2}}=0.282
\end{aligned}
$$

$$
\text { Eq. } 6.46
$$

$$
\mathrm{C}:=\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\mathrm{d}}^{2}}{\mathrm{~m}_{1} \cdot \mathrm{k}_{1}^{2}}+\mathrm{m}_{\mathrm{C}} \cdot \frac{\mathrm{~d}_{\mathrm{b}}^{2}}{\mathrm{~m}_{2} \cdot \mathrm{k}_{2}^{2}}=1.214
$$

Ratio of Initial Tangential to Normal Velocities:

$$
\left.\begin{array}{ccc}
\mathrm{r}=\mathrm{v}_{\mathrm{mn}} / \mathrm{v}_{\mathrm{m}} \\
\mathrm{r}:=\frac{\mathrm{v}_{\mathrm{ct} 2}-\mathrm{v}_{\mathrm{ct1}}}{\mathrm{v}_{\mathrm{cn} 2}-\mathrm{v}_{\mathrm{cn} 1}}=1
\end{array} \quad \begin{array}{l}
\text { Angle between relative } \\
\text { velocity and normal }
\end{array}\right\} \begin{gathered}
\text { Eq. } 6.60 \\
\text { to } 6.62
\end{gathered}
$$

$$
\varepsilon:=0.355 \quad \beta:=1
$$

Vcrn $=-\varepsilon * \operatorname{vcrn}$ (crn=point C, relative, normal)
An important quantity is the Impulse Ratio, $\boldsymbol{\mu}$, that gives the tangential common velocity condition, that is, where $\mathbf{V}_{\mathbf{1 C t}}-\mathbf{V}_{\mathbf{2 C t}}=\mathbf{0}$. This gives the critical impulse ratio $\mu_{\mathrm{o}}$.
Let $\beta$ be the fraction of $\mu_{0}$ that is used for the reconstruction. Then $\mu=\beta * \mu_{0}$, as shown below.

$$
\begin{array}{lrrrr}
\mathbf{P}_{\mathbf{t}}=\boldsymbol{\mu} \mathbf{P}_{\mathbf{n}} & \mu_{\max }(\varepsilon):=\frac{\mathrm{r} \cdot \mathrm{~A}+(1+\varepsilon) \cdot \mathrm{B}}{(1+\varepsilon) \cdot(1+\mathrm{C})+\mathrm{r} \cdot \mathrm{~B}} & \text { Eq. } 6.60 & \mu_{\text {max }}(\varepsilon)=0.512 & \mu(\varepsilon, \beta):=\beta \cdot \mu_{\text {max }}(\varepsilon) \\
\mathrm{d}_{\mathrm{e}}(\varepsilon, \beta):=\mathrm{d}_{\mathrm{c}}-\mu(\varepsilon, \beta) \cdot \mathrm{d}_{\mathrm{d}} & \mathrm{~d}_{\mathrm{f}}(\varepsilon, \beta):=\mathrm{d}_{\mathrm{a}}-\mu(\varepsilon, \beta) \cdot \mathrm{d}_{\mathrm{b}} & \text { Eq. } 6.59 & \mu(\varepsilon, 1)=0.512
\end{array}
$$

## $\mathbf{q}$ is the Brach rotation parameter

$$
\begin{equation*}
\mathrm{q}(\varepsilon, \beta):=(\mathrm{A}-\mu(\varepsilon, \beta) \cdot \mathrm{B})^{-1} \tag{Eq 6.55}
\end{equation*}
$$

## Brach Planar Impact: Given six initial conditions $v x, v y, \omega$ for each vehicle plus $\varepsilon$ and $\mu$

 Results in planar solution/equations for the $\mathbf{8}$ unknowns: Final $\mathbf{V x}, \mathbf{V y}, \Omega, P$ ) for each vehicle$$
\begin{array}{ll}
\Omega_{1}(\varepsilon, \beta):=\omega_{1}+\mathrm{m}_{\mathrm{C}} \cdot(1+\varepsilon) \mathrm{v}_{\mathrm{rn}} \cdot \mathrm{~d}_{\mathrm{e}}(\varepsilon, \beta) \cdot \frac{\mathrm{q}(\varepsilon, \beta) \cdot 180}{\pi \cdot \mathrm{I}_{1}} & \text { Eq. } 6.52 \text { and } 6.53 \\
\Omega_{1}(\varepsilon, 1)=-199.702 \frac{1}{\mathrm{~s}} \\
\Omega_{2}(\varepsilon, \beta):=\omega_{2}+\mathrm{m}_{\mathrm{C}} \cdot(1+\varepsilon) \mathrm{v}_{\mathrm{rn}} \cdot \mathrm{~d}_{\mathrm{f}}(\varepsilon, \beta) \cdot \frac{\mathrm{q}(\varepsilon, \beta) \cdot 180}{\pi \cdot \mathrm{~m}_{2} \cdot \mathrm{k}_{2}{ }^{2}} & \Omega_{2}(\varepsilon, 1)=87.322 \frac{1}{\mathrm{~s}}
\end{array}
$$

## Planar Impact (Rigid Body Impact) Mechanics

## Impact $\Delta V$ and Impulse

$$
\begin{array}{ll}
\Delta \mathrm{V}_{1}(\varepsilon, \beta):=\sqrt{\left(\mathrm{v}_{\mathrm{n} 1}-\mathrm{V}_{\mathrm{n} 1}(\varepsilon, \beta)\right)^{2}+\left(\mathrm{v}_{\mathrm{t} 1}-\mathrm{V}_{\mathrm{t} 1}(\varepsilon, \beta)\right)^{2}} & \text { Impulse }_{1}(\varepsilon, \beta):=\mathrm{m}_{1} \cdot \Delta \mathrm{~V}_{1}(\varepsilon, \beta) \\
\Delta \mathrm{V}_{2}(\varepsilon, \beta):=\sqrt{\left(\mathrm{v}_{\mathrm{n} 2}-\mathrm{V}_{\mathrm{n} 2}(\varepsilon, \beta)\right)^{2}+\left(\mathrm{v}_{\mathrm{t} 2}-\mathrm{V}_{\mathrm{t} 2}(\varepsilon, \beta)\right)^{2}} & \text { Impulse }_{2}(\varepsilon, \beta):=\mathrm{m}_{2} \cdot \Delta \mathrm{~V}_{2}(\varepsilon, \beta) \\

\operatorname{PDOF} 2(\varepsilon, \beta):=\operatorname{if}(180+\operatorname{PF} 2(\varepsilon, \beta) \leq-180,180+\operatorname{PF} 2(\varepsilon, \beta)+360, \operatorname{IFP} 2(\varepsilon, \beta))
$$

## Brach Planar Collision Model Assumptions:

$$
\begin{aligned}
& \begin{array}{l}
\mathrm{AT}(\varepsilon, \beta):=\frac{180}{\pi} \cdot \operatorname{atan}\left(\left|\frac{\mathrm{P}_{\mathrm{y} 1}(\varepsilon, \beta)}{\mathrm{P}_{\mathrm{x} 1}(\varepsilon, \beta)}\right|\right) \quad \begin{array}{lll}
-90 \leq \theta_{1} \leq 0 & -180 \leq \theta_{1} \leq-90 & 90 \leq \theta_{2} \leq 180 \\
\mathrm{AT}(\varepsilon, \beta)=27.127
\end{array} \\
0 \leq \theta_{1} \leq 90 \\
\hline 180 \leq \theta_{1} \leq 180 \\
-180 \leq \theta_{2} \leq-90
\end{array} \\
& \mathrm{t} 1:=\operatorname{if}\left(\theta_{1} \geq 0, \theta_{1}, \theta_{1}+360\right) \quad \mathrm{t} 2:=\operatorname{if}\left(\theta_{2} \geq 0, \theta_{2}, \theta_{2}+360\right)
\end{aligned}
$$

There is a common crush plane at a point, C.
The time duration of an Impact is small, thus changes in mass centers and angles are small.
Collision forces much greater than any of the other forces, e.g. friction, and very short.
Use Impulse and conservation of momentum --> no integration is necessary.
Preimpact dimensions are used. Changes in angular momentum equal to moments of impulses.
Newton's equations not enough information. Must use normal and tangential impact processes, $\varepsilon \& \mu$ Find Six unknowns, Given 4 eqs. Two Constraints: Coefficients of Restitution, $\varepsilon$ and Impulse Ratio, Therefore, to get post velocities, we must have knowledge of $\varepsilon$ and an estimate of $\mu$

## Find Optimal Solution: Least Error for V \& $\boldsymbol{\Omega}$

Found by a Least Square Fit between the known Final RICSAC Velocities and Calculated Values

## Known Final Velocities for RICSAC 9

$$
\begin{array}{lll}
\mathrm{V}_{\mathrm{xk} 1}:=-5.1 \frac{\mathrm{ft}}{\mathrm{~s}} & \mathrm{~V}_{\mathrm{yk} 1}:=17.6 \frac{\mathrm{ft}}{\mathrm{~s}} & \Omega_{\mathrm{k} 1}:=-180 \cdot \frac{1}{\mathrm{~s}} \\
\mathrm{~V}_{\mathrm{xk} 2}:=-7.3 \frac{\mathrm{ft}}{\mathrm{~s}} & \mathrm{~V}_{\mathrm{yk} 2}:=20.2 \frac{\mathrm{ft}}{\mathrm{~s}} & \Omega_{\mathrm{k} 2}:=45 \cdot \frac{1}{\mathrm{~s}}
\end{array}
$$

> Define Least Squares Error Functions, $\mathbf{V}_{\text {error }}(\boldsymbol{\varepsilon})$ and $\boldsymbol{\Omega}_{\text {error }}(\boldsymbol{\beta})$ $\mathrm{V}_{\mathrm{error}}(\varepsilon \mathrm{x}, \beta):=\left[\left(\mathrm{V}_{\mathrm{x} 1}(\varepsilon \mathrm{x}, \beta)-\mathrm{V}_{\mathrm{xk} 1}\right)^{2}+\left(\mathrm{V}_{\mathrm{y} 1}(\varepsilon \mathrm{x}, \beta)-\mathrm{V}_{\mathrm{yk} 1}\right)^{2}+\left[\left(\mathrm{V}_{\mathrm{x} 2}(\varepsilon \mathrm{x}, \beta)-\mathrm{V}_{\mathrm{xk} 2}\right)^{2}+\left(\mathrm{V}_{\mathrm{y} 2}(\varepsilon \mathrm{x}, \beta)-\mathrm{V}_{\mathrm{yk} 2}\right)^{2}\right]\right]$ Guess $\quad \varepsilon \mathrm{x}:=0.1 \quad \beta:=1$
Constraints

$$
\text { Given } \quad \varepsilon x \geq 0 \quad \beta \leq 1
$$

## Use Mathcad Minimize() Function to Find Values of copt and 乃opt for Minimum V \& $\boldsymbol{\Omega}$ Error

$$
\varepsilon \beta_{\mathrm{opt} 2}:=\operatorname{Minimize}\left(\mathrm{V}_{\mathrm{error}}, \varepsilon \mathrm{x}, \beta\right) \quad \varepsilon \beta_{\mathrm{opt} 2}=\binom{0.355}{1} \quad \varepsilon_{\mathrm{opt}}:=\varepsilon \beta_{\mathrm{opt} 2} \quad \beta_{\mathrm{opt}}:=\varepsilon \beta_{\mathrm{opt} 2}
$$

## Plot Least Squares Error to Find Optimum $\varepsilon$ (عopt) and 乃opt for Minimum V and $\boldsymbol{\Omega}$ Error

 Min Velocity Error vs. Coefficient of Restitution

Coefficient of Restitution

Impulse Ratio vs. Coefficient of Restitution

Coefficient of Restitution

Impact2 vs. Coefficient of Restitution

Coefficient of Restitution

PDOF1 vs. Coefficient of Restitution

PDOF2 vs. Coefficient of Restitution

Coefficient of Restitution

Note: In a Planar Collision a Coefficient of Restitution of 0 can still result in After Collision KE, because of Final Angular Momentum $\Omega$ and Tangential Impulse.
\%KE Loss vs. Coefficient of Restitution
